

JavaScript Tasks

Task 1: Using console.log() and Variables

Task:

1. Create variables of different data types:
 - String.
 - Number.
 - Boolean.
 - Null and Undefined.
2. Use console.log() to print the values of these variables in the Console.
3. Use typeof to check the type of each variable and display it using console.log.
4. Create two string variables (firstName and lastName) and concatenate them:
 - Using the old way (via +).
 - Using the modern approach (via Template Literals).

Task 2: Working with Data and Basic Validation

Task:

1. Create two variables containing text:
 - Username.
 - Password.
2. Perform a basic validation using if:

- If the username is empty, display an alert saying: "Username is required".
 - If the password is less than 8 characters, display an alert saying: "Password must be at least 8 characters".
3. Use `console.log()` to display the username and password after they pass the validation.
