

Task 1: Functions and Callback Functions

Task:

1. Create a **multiply** function that takes two numbers as parameters and returns their multiplication.
2. Create a function called **calculate** that accepts two numbers and a function (multiply from step 1). The function **calculate** should perform the operation passed to it.
3. **Callback:** Create another function **displayResult** that accepts the result of the calculation from **calculate** and displays it using **console.log()**.
4. Call the **calculate** function and pass **multiply** and two numbers as parameters.

Task 2: Working with `setTimeout` and `setInterval`

Task:

1. **setTimeout Example:**
 - a. Create a **greetUser** function that logs the message "Hello, User!" after 3 seconds using **setTimeout**.
2. **setInterval Example:**
 - a. Create a **countdown** function that counts down from 10 to 1 and logs each number every second.
 - b. After the countdown reaches 0, display the message "Time's up!".
3. **Clear setInterval:**
 - a. Modify the **countdown** function to stop the interval after 5 seconds using **clearInterval**.
4. **Clear setTimeout:**
 - a. Use **setTimeout** to log a message "This will be cleared!" after 5 seconds and then use **clearTimeout** to cancel the message before it appears.
